

(a)

(b)

(c)

**Figure 4** Smarthome's 2412S PowerLinc Modem is outlet-sensitive, at least in my setup, and it must be fully powered before you power up Universal Devices' ISY-26 to reliably manage it (a). The Smarthome 2443 access points aren't seemingly acting as the wireless phase couplers they're intended to be, although the reason why is unclear (b). Once I get my Insteon network to a more robust state, I'll advance it beyond its current humble implementation, switching two incandescent lamps via Smarthome 2856S3B on/off adapters (c).
