Introduction

The makers of handheld medical, industrial, and consumer devices use a wide variety of high resolution, small to medium sized color TFT LCD displays. The power supply designers for these displays must contend with shrinking board area, tight schedules, and variations in display types and feature requirements. The LTC3524 simplifies the designer’s job by combining a versatile, easily programmed, TFT LCD bias supply and white LED backlight driver in a low profile 4×4mm QFN package.

The LTC3524’s 2.5 to 6V input supply range is ideally suited for portable devices powered from Li-Ion or multiple alkaline or nickel cells. Both the LCD and LED drivers operate at 1.5MHz, allowing the use of tiny, low cost, inductors and capacitors.

![Figure 289.1 • LTC3524 TFT LCD Supply Sequencing at Power-Up and Power-Down](image-url)
The TFT bias portion of the circuit consists of a synchronous boost converter, adjustable between 3 and 6V, providing the main analog $V_{\text{OUT}}$ for the TFT. Low current gate drive voltages (VH and VN) are generated using integrated charge pump circuits. These low noise outputs are programmable to ±20V, allowing optimal bias for multiple display types and makers. The TFT outputs are sequenced at power-up and discharged at power-down as shown in Figure 289.1.

A second non-synchronous boost converter generates the voltage required to regulate one or two LED strings at up to 25mA each. LED current can be adjusted by either analog or digital means, optimizing the TFT display for varying ambient light conditions. Each string is independently enabled and can contain one to five LEDs in series. Internal circuitry maintains equal current in the strings, even when the forward voltage drops of the LEDs do not match. Open LED protection is provided to prevent the output from exceeding 24V.

A 3-output TFT supply with digitally dimmed LED backlight

A LTC3524-based TFT and backlight solution for a 4 to 6 inch LCD is shown in Figure 289.2. High frequency operation of the power components and the QFN package shrinks the total converter footprint to approximately 120mm² (single sided). The circuit schematic is shown in Figure 289.3. The TFT bias portion of the circuit provides a 5V, 25mA output for the TFT drivers as well as 12.5 and −7.5V outputs with up to 2mA for the gate bias. These voltages are programmed using the
FBVO, FBH, and FBN pins respectively.

As shown in Figure 289.1, these outputs are sequenced with $V_{\text{OUT}}$, VN, then VH powered, as required by most displays. The outputs are actively discharged when ELCD is brought low, removing voltage from the display. The white LED backlight for the Figure 289.3 circuit consists of two strings with four series LEDs. The LEDs are driven from the high side with the LTC3524, allowing the strings to terminate at ground, reducing the number of wires required to power the display. With $R_{\text{PROG}} = 100\,\text{k}$, each LED is regulated to 20mA. Maximum power for the backlight is approximately 600mW, assuming a forward voltage around 3.6V per element.

Dimming is achieved by changing the duty cycle of a 200Hz power signal applied to the LED strings. The frequency is high enough to prevent visually detectable flickering, but low enough to allow a better than 100:1 dimming range. Dimming is implemented by simply connecting a microprocessor controlled port to ELED1 and ELED2. Scope waveforms at 50% duty cycle are shown in Figure 289.4.
Efficiency results for this design are given in Figure 289.5 with a 3.6V input. The LCD efficiency curve shows the performance of the synchronous boost converter with $V_{\text{OUT}}$ at 5V and varying load current. This curve includes the no load quiescent current of the charge-pumps, which are powered from $V_{\text{OUT}}$. Analog dimming of the LEDs can be implemented by adjusting the current through the PROG pin. Efficiency for analog dimming is shown in Figure 289.5. Efficiency with PWM dimming would remain close to 78% over a wide dimming range.
Conclusion

The LTC3524 shrinks and simplifies the design of small to medium sized TFT LCDs by combining the LCD supply and LED driver in a single compact package. LCD bias voltages and LED currents are programmable, making it possible to simplify parts stock by using the LTC3524 for a wide variety of displays.
